Designing 4 to 20 mA Current Loops - BAPI

4-20 mA current loops is widely used in the industrial process applications. The 4-20 mA current loop enables long cable runs and is robust against interference of electromagnetic noise. The common 4-20 mA current loop uses only two-wires where the supply of power to the

Making a Tiny 4-20mA Current Loop Tester

The idea behind 4-20 mA current loop operation is that the sensor draws

current from its power source in direct proportion to the mechanical property it measures. Take the example of a 100 psi sensor with a current loop output. With 0 psi applied, the sensor draws 4 mA from its power source. With 100 psi applied the sensor draws 20 mA.

The 4 to 20 mA current loop is a very robust sensor signaling standard.

Current loops are ideal for data transmission because of their inherent insensitivity to electrical noise.

Designing 4 to 20 mA current loops is just managing the voltage drops around the loop. The voltage drops occur in the

In fact many older machines (prior to the 1960s) used a 60 mA current loop system, although later machines adopted a 20mA current loop standard - the first one being the Model 33 teletype. Nowadays the current loop

dominant standard in many industries. It is the simplest option to connect and configure. It uses less wiring and connections than other signals, greatly reducing initial setup costs. Better for traveling long distances, as current does not degrade over long connections like voltage.
