Example: multiply the
vector $m = (7, 3)$ by
the scalar 3. $a = 3m =$
 $(3 \times 7, 3 \times 3) = (21, 9)$ It
still points in the same
direction, but is 3 times
longer. (And now you
know why numbers are
called "scalars",
because they "scale"
the vector up or down.)

Vectors - MATH

Vector graphics are computer graphics images that are defined in terms of points on a Cartesian plane, which are connected by lines and curves to form polygons and other shapes. Vector graphics have the unique advantage over raster graphics in that the points, lines, and curves may be scaled

A vector pointing from A to B. In mathematics, physics, and engineering, a Euclidean vector (sometimes called a geometric or spatial vector, or—as here—simply a vector) is a geometric object that has magnitude (or length) and direction. Vectors can be added to other vectors according to vector algebra.

size() - Returns the number of elements in the vector. max_size()

- Returns the maximum number of elements that the vector can hold.

capacity() - Returns the size of the storage space currently allocated to the vector expressed as number of elements. resize(n) - Resizes the container
