Advanced Electrical Principles Dc

An electric motor is a machine which converts electrical energy into mechanical energy whereas a generator is that machine which converts mechanical energy into electrical one. As regards fundamental principles the dc motors are identical with the dc generators which have the same type of excitation i.e, a machine that operates as a motor will also operate satisfactorily as a generator.

oppose changes to electric currents. An electric current sets up an electric field across the plates of a capacitor. This opposes changes to the voltage applied to the capacitor. Before the volt-age can increase, electrons must flow onto the plates of the capacitor, increasing the electric field. This requires energy.
