ADGDP - Advances in Geophysical Data Processing

Geophysical Data Processing. Great advancements were made in the development of appropriate tools for the processing and visualisation of the geophysical prospection data which capable of efficiently handling very large quantities of high-resolution data. The functionality to process and visualise magnetic and GPR data recorded along irregular paths was developed, tested, and continuously improved, resulting in streamlined, highly effective geophysical data processing solutions, including ...

The two main goals of geophysical signal processing are: improvement of the signal-to-noise ratio, and results representation in a convenient manner to facilitate geological and geophysical interpretation. If the geophysical signal processing is not effective nor well performed, then the data handling will be more tedious and more time consuming.
