Four species of *Alternaria* are wide spread and most devastating on cruciferous oil yielding crops, vegetables, forage crops, ornamental plants, and numerous weeds all over the world. The damage to the plants is in the form of infections on seed in the soil during sowing, on seedlings during emergence and growth, on stem, leaves, inflorescence, pods and finally to the seed causing yield losses in seed quantity and quality.

Damping-off disease affects crucifer seedlings grown in flats and seedbeds, or in the field. Damping-off is normally caused by soil fungi such as *Pythium* and *Rhizoctonia*. Seed and young seedlings are attacked and may rot before they emerge or topple over a few days afterwards.

Alternaria species are simple parasites that survive saprophytically outside the host. Diseased crop debris is the primary site of survival from year to year. Resting spores (chlamydospores, microsclerotia) have been reported. The diseases are favored by warm temperatures (60-78° F) and at least 12 hours of relative humidity of 90 % or more.

The disease is caused by oomycetous fungus, *Albugo candida* (syn. *Cystopus candidus*). It is an obligate parasite (biotroph). Pathogen produces basipetal chain of sporangia/conidia born on the small club-shape conidiophores inside the pustules. The nature of sporangia or conidia depends upon the temperature and humidity.
