Classical Mechanics: With Introduction to Nonlinear ...

Classical mechanics is a physical theory describing the motion of macroscopic objects, from projectiles to parts of machinery, and astronomical objects, such as spacecraft, planets, stars and galaxies. For objects governed by classical mechanics, if the present state is known, it is possible to predict how it will move in the future (determinism) and how it has moved in the past (reversibility).

However, Physics 228 is required for several upper division physics classes, including Optics Lab (Phys 331), Classical Mechanics (Phys 329), Quantum Mechanics 2 (Phys 324), and Phys 324 is a pre-requisite for Physics 325 as well as the 400-level electives for nuclear, condensed matter, and atomic physics (422, 423 and 421).

Classical mechanics is the abstraction and generalisation of Newton's laws of motion undertaken, historically, by Lagrange and Hamilton. This note will introduce the two main approaches to classical mechanics: 1. the variational formulation 2.
