Contrast Enhanced Ultrasography Of Focal

Access Free Contrast

Contrast-enhanced ultrasound (CEUS) is an imaging method that has been used in European and Asian countries for more than 10 years. The use of ultrasound contrast agents has been approved in several countries, but the Food and Drug Administration (FDA) in the United States has not yet approved their application for a noncardiac use.

ultrasound and magnetic resonance in the late and hepatobiliary phases of 147 focal liver lesions. Evaluating all 147 focal liver lesions, our study showed that diagnostic errors were made in 13/147 (8.8%) by means of CEUS (Figures 1 and 2) and 12/147 (8.2%) by means of CE-MR (Figure 2), respectively.

Ultrasound contrast agents (UCA) are gas-filled microspheres which reflect sound waves and enhance the ultrasound image. First introduced in 1996, they have been used for decades in >40 countries, primarily in Europe and Asia, for cardiac and abdominal imaging [1]. The various UCA
