Thus a disc rotating at 60 rpm is said to be rotating at either 2π rad/s or 1 Hz, where the former measures the angular velocity and the latter reflects the number of revolutions per second. If the non-SI unit rpm is considered a unit of frequency, then $1 \text{ rpm} = 1 / 60 \text{ Hz}$.

Obviously the reverse does not apply because the 60 Hz
(designed) transformer - assuming it has 1.5 T flux density for
rated voltage - will end up at $60/50 \times 1.8$ T when connected to
the same system voltage but at 50 Hz. This will cause many a
modern (fully rated) 60 Hz transformer to overheat, due to the
saturation of the core.
