Beams are horizontal structural elements designed to carry lateral loads. When they are inclined or slanted, they are referred to as raker beams. Floor beams in a reinforced concrete building are normally designed to resist load from the floor slab, their own self-weight, the weight of the partitions/cladding, the weight of finishes, and other actions as may be applied.

The design safety of structures may be evaluated in either of the two ways: Allowable Stress Design; Load and resistance factor design; A. Allowable stress design: Based on linear elastic behavior of the material. The stress is in allowable limits. The full strength of the material is not utilized but we use less value as the limited stress value.
