Digital Radiography - X-Ray Radiation Advanced NDT. Digital radiography is an advanced technology based on digital detector systems in which the x-ray image is displayed directly on a computer screen without the need for developing chemicals or intermediate scanning. The incident x-ray radiation is converted into an equivalent electric charge and then to a digital image through a detector sensor.

So the first chart you will see has the optimum kV that can be used in digital radiography for both CR and DR. This is true for every vendor except Konica who built their CR system to use 5-10 kV less than everyone else. This means that Konica uses 5-10 kV higher than film-screen and all other vendors use 15-20 kV more than f-s.

When the object being radiographed is ≥ 10 cm thick (15 cm for digital systems), scattering becomes a problem by causing unwanted exposure of the x-ray film. A grid, which is a thin plate made up of alternating thin strips of lead and plastic, can be placed between the animal and the film to reduce the scattered x-rays from exposing the film.
