PULSED-FIELD GEL ELECTROPHORESIS □ Pulsed field gel electrophoresis is a technique used for the separation of large DNA molecules by applying to a gel matrix an electric field that periodically changes direction. □ While in general small fragments can find their way through the gel matrix more easily than large DNA fragments, a threshold length exists above 30-50 kb where all large fragments will run at the same rate, and appear in a gel as a single large diffuse band.

different techniques to separate and quantify these samples. Basics and Theory of Electrophoresis The two most commonly used methods of sample separation are chromatography and electrophoresis. Chromatography: ideal for small molecules and has high selectivity. Electrophoresis: most often used for proteins and other small biological molecules like DNA.
