Electromechanical Valve Actuator for Variable Valve Timing

The intake runner control valve diverts air to longer, narrow runners during low RPMs, and shorter, wider runners for higher RPMs. Each intake runner control valve is controlled by the ECU for precise timing to maximize performance and efficiency.

An intake manifold consists of the plenum and runners, see the photo. In some V6 and V8 engines, an intake manifold can be made of several separate sections or parts. The intake air flows through the air filter, intake boot (snorkel), then through the throttle body, into the plenum, then through the runners and into the cylinders (see diagram).

Engine Intake Valve Actuator

An Intake Valve Actuator or IVA (also known as a Variable Valve Actuator or VVA) is a device that contacts the intake rocker arm and holds the intake valve of an ACERT Cat engine open in an effort to lower the cylinder temperatures of the engine. This is done to help lower NOX emissions.

The intake manifold runner control is an engine management component that is found on newer intake manifold designs. It is usually a motorized or vacuum actuated unit attached to the intake manifold, that controls the opening and closing of butterfly valves inside of the intake manifold runners.

Intake Manifold Runner Control Valve | O'Reilly Auto Parts

An engine equipped with a variable valve timing actuation system is freed from this constraint, allowing performance to be improved over the engine operating range. Piston engines normally use valves which are driven by camshafts. The cams open (lift) the valves for a certain amount of time (duration) during each intake and exhaust cycle.
