Genomic medicine, sometimes also known as personalized medicine, is a way to customize medical care to your body's unique genetic makeup. Each of the cells in the body contains DNA, the molecules you inherit from your parents that determine how your body looks and functions. DNA is arranged like a twisted ladder, with information stored in the arrangement, or sequence, of the rungs.

Genomic medicine—the use of genetic information to inform medical care or predict risk of disease—is beginning to transform health care. The first human genome cost about US\$3 billion to sequence.^{1,2} A whole human genome can now be sequenced for under \$1000, and for even less it is possible to read targeted parts of the genome (panels) or the protein coding part (the exome).
