The curve complex and its relatives  
The chance of a lesion with a type 2 curve being malignant lies somewhere between the 6% of the type 1 curve and the 29-77% of the type 3 curve. Many physicians will biopsy lesions with type 2 curves. For non-mass enhancement, kinetics are not very useful.

Abstract. We study a family of stable curves defined combinatorially from a trivalent graph. Most of our results are related to the conjecture of Green which relates the Clifford index of a smooth curve, an important intrinsic invariant measuring the “specialness” of the geometry of the curve, to the “resolution Clifford index,” a projective invariant defined from the canonical ...

B. Thus at each point in the convex core, there are nontrivial curves of length less than  $B$ . The shortest homotopically non-trivial curves are simple curves, and so as we pass through the manifold, we can ask where these short curves lie in the Farey graph. This gives us a (coarse) map from the space of quasi-Fuchsian torus groups to paths in the

Example of non-liftable curve (cont'd)  
This is not liftable to a curve over  $K$  because 1 three unbounded edges in each direction in the curve shows that it must be a cubic, 2 the loop in the curve shows that any lift must have genus at least 1, 3 any classical cubic is either genus 0 and spatial or genus 1 and planar, Eric Katz (Texas/MSRI) Lifting Tropical Curves November 7, 2010 9 / 31

The Radiology Assistant : MRI of the Breast  
MSRI Publications -- Volume 35. The Eightfold Way: The Beauty of Klein's Quartic Curve. Edited by Silvio Levy Felix Klein discovered in the 1870's that the simple and elegant equation  $x^3 + y^3 + z^3 = 0$  (in complex projective coordinates) describes a surface having many remarkable properties, including 336-fold symmetry -- the maximum possible for any surface of this genus.

course at MSRI Background for holomorphic curve analysis: List of good things to know, most of which can be found in Appendix A,B from McDuff-Salamon J-holomorphic Curves and Symplectic Topology and Lecture notes on Fredholm theory by Tom Mrowka (from OpenCourseWare: Geometry of Manifolds) Lecture notes: lecture 1 (Introduction and Gromov nonsqueezing),

Holomorphic Curves at MSRI of curves and arcs, which has as vertices not only curves but also (properly embedded) arcs with endpoints on the boundary of the surface; edges still connect vertices with disjoint representatives. In high complexity ( $\sim 3$ ), the curve complex and the complex of curves and arcs are quasi-isometric, so have the same coarse geometry.
