Cellular homeostasis involves maintaining a balance of several factors that make a cell healthy. The cell membrane is a lipid bilayer that prevents that passage of water and ions. This allows cells to maintain a higher

Whereas the cell wall simply serves to protect the cell (as well as the cell membrane which is located beneath it) the plasma membrane has a number of functions that include cell division, motility, signaling and reception, transportation as well as maintaining cell homeostasis. The plasma membrane, then, has many important functions that

Events in Cholesterol Transport and Homeostasis Cholesterol transport between intracellular compartments proceeds by both energy- and non-energy-dependent processes. Energy-dependent vesicular traffic partly contributes to cholesterol flux between endoplasmic reticulum, plasma membrane, and endocytic vesicles.
