Probability = (Number of a Favourable outcome) / (Total number of outcomes)  $P = n(E) / n(S)$

Where P is the probability, E is the event and S is the sample space. Now, let's look at some very common examples. Example 1: Probability of getting an even number on rolling a dice once.

Probability is the branch of mathematics concerning numerical descriptions of how likely an event is to occur, or how likely it is that a proposition is true. The probability of an event is a number between 0 and 1, where, roughly speaking, 0 indicates impossibility of the event and 1 indicates certainty.

An Introduction to Probability Theory and Its Applications uniquely blends a comprehensive overview of probability theory with the real-world application of that theory. Beginning with the background and very nature of probability theory, the book then proceeds through sample spaces, combinatorial analysis, fluctuations in coin tossing and random walks, the combination of events, types of distributions, Markov chains, stochastic processes, and more.
