...

Tests of Attention. Testing someone's ability to pay attention is more complicated than it sounds. Attention is composed of four major components: selective attention (the ability to attend to stimuli while ignoring distractions), sustained attention (the ability to maintain attention over an extended period of time), divided attention (multi-tasking; the ability to attend to more than one ...

ADHD Testing - Attention, Executive Functioning and Memory

The Processing Test REST-INH was inspired by the classic Variables of Attention (TOVA) test. The task helps to perceive, process, and respond to a stimulus. Depending on the processing speed, the response time will be affected to a greater or lesser extent. It will also allow the user to ignore irrelevant or unimportant stimuli.

Concentration Test. This page is designed to test your concentration. But before starting the test, you need to know what it is all about. Concentration or "attentional control" refers to people's ability to choose what they pay attention to or ignore. Put it simply like this, concentration can be described as an individual's ability to focus.

Concentration Test - happy brain

Overview of the Memory Process. Encoding is the process of getting information into memory. If information or stimuli never gets encoded, it will never be remembered. Encoding requires paying attention to information and linking it to existing knowledge in order to make the new information meaningful and thus easier to remember.. Storage consists of retention of information over time.

Memory Process - encoding, storage, and retrieval

A common task that isolates controlled attention to exclusion of simple memory demands is the Stroop test (Stroop, 1935). In a typical Stroop test, a subject is required to identify the color of a word that is briefly (e.g., 50 ms) presented. In the simple form of this test, subjects' accuracy is normally quite good.

Selective Attention, Working Memory, and Animal Intelligence

This increases the likelihood that information will shift from short- to long-term memory. A child can stay active and improve recall by playing with a fidget toy. Manipulating materials with her hands extends a child's attention span and focus. The ADHD brain loves variety, brevity, and novelty.

Interactions between attention and memory Marvin M Chun and Nicholas B Turk-Browne Attention and memory cannot operate without each other. In this review, we discuss two lines of recent evidence that support this interdependence. First, memory has a limited capacity, and thus attention determines what will be encoded.
