## **Pectoralis Major Myocutaneous Flap In**

Introduction The pectoralis major myocutaneous flap for reconstruction was first described in 1968. Its application in the head and neck region, however, was not reported until Ariyan's publication in 1979. The reliability and versatility of this flap were subsequently confirmed by many other reports.

## **Pectoralis Major Myocutaneous Flap - American Head & Neck ...**

The pectoralis major myocutaneous flap has definite advantages over other myocutaneous flaps used in closing head and neck defects. The trapezius myocutaneous flap requires a skin graft to the donor area and there is a temporary orocutaneous fistula. It has a limited arc of rotation and a division of the flap is necessary as a second procedure.

## **Pectoralis Major Myocutaneous Flap in Head and Neck Surgery**

Both the major arteries were enclosed within the muscle's fascial envelope. A technique for developing a standard pectoralis major myocutaneous island flap is described. Our studies show that a hemichest flap incorporating all the skin of the chest over the muscle is feasible.

## **The vascular anatomy of the pectoralis major myocutaneous flap**

The pectoralis major myocutaneous flap has become the primary reconstructive flap in head and neck surgery. We have reviewed our experience and describe some modifications of incisions for elevation of this flap which will improve cosmetic results in both male and female patients.

## **Refinement of the pectoralis major myocutaneous flap.**

The pectoralis was one of the early workhorse flaps, but it has largely been supplanted by free flaps. The trapezius myocutaneous flap can be designed in several directions. The horizontal trapezius fasciocutaneous flap is an excellent choice for major coverage problems of the neck because of its proximity and favorable color match.
