What types of intermolecular forces exist between HI and H2S

Hydrogen sulfide (H₂S) is readily water soluble, and, at physiological pH, about two-thirds exists as hydrogen sulfide ion (HS⁻) and one-third as undissociated H₂S. We use the generic term "sulfide" to refer to both species. Sulfide is an endogenous signal transmitter via protein sulfhydration, and, at low intracellular concentrations—0.01 to 1 μ M—donates electrons to complex ...

In this paper, a hydrogen sulfide (H2S) gas safety monitoring system using industrial toxic gas sensor (Ultra1000) is developed. Zigbee stack is used for the wireless communication. The system has two types of end nodes: An industrial gas sensor which is also referred to as the "Special End Node (SEN)" and the end nodes attached to the workers suit earlier referred to as "Worker End Node (WEN)".

Hydrogen sulfide (H₂S) has come a long way from air pollutant, to intermediate in sulfur assimilation, to signalling molecule. Using a proteomic approach, Aroca et al. investigated post-translational modifications of cysteine residues (protein persulfidation) controlled by H₂S to show that at least 5% of the entire proteome encoded by the Arabidopsis genome is persulfidated and, completing ...

Hydrogen sulfide can be produced in small amounts from sulfur containing amino acids like cysteine by a large number of bacteria in carbohydrate media. Hydrogen sulfide produces on contact with lead acetate a black precipitate, indicated by a visible black-colored reaction on the hydrogen sulfide paper strip.

Abstract. Hydrogen sulphide (H₂S) is the primary chemical hazard in natural gas production in 'sour' gas fields. It is also a hazard in sewage treatment and manure-containment operations, construction in wetlands, pelt processing, certain types of pulp and paper production, and any situation in which organic material decays or inorganic sulphides exist under reducing conditions.
