Computer science as an academic discipline began in the 1960's. Emphasis was on programming languages, compilers, operating systems, and the mathematical theory that supported these areas. Courses in theoretical computer science covered finite automata, regular expressions, context-free languages, and computability. In the 1970's, the study of algorithms was added as an important component ...

If w has an odd number of 1's, then so does z . By the inductive hypothesis, $\delta\text{-hat}(A,z) = B$, and the transitions of the DFA tell us $\delta\text{-hat}(A,w) = B$. Thus, in this case, $\delta\text{-hat}(A,w) = A$ if and only if w has an even number of 1's. Case 2: $a = 1$. If w has an even number of 1's, then z has an odd number of 1's.
