In the common emitter amplifier shown, the transistor has a forward current gain of 100, and a base to emitter voltage of 0.6 volts. Assume  $I_{CO}$  to be negligible. Choose value for  $R_1$  and  $R_3$  such that the transistor has a collector current of 1 mA and a collector to emitter voltage of 2.5 volts.

Bipolar Transistors are current regulating devices that control the amount of current flowing through them in proportion to the amount of biasing voltage applied to their base terminal acting like a current-controlled switch. The principle of operation of the two transistor types . NPN. and . PNP, is exactly the same the
