Once all the par term structure rates have been derived, we use the bootstrapping method for deriving the zero curve from the par term structure. This is an iterative process that allows us to derive a zero coupon yield curve from the rates/ prices of coupon bearing instruments.

Financial bootstrapping in small businesses: Examining ...

In finance, bootstrapping is a method for constructing a (zero-coupon) fixed-income yield curve from the prices of a set of coupon-bearing products, e.g. bonds and swaps. A bootstrapped curve, correspondingly, is one where the prices of the instruments used as an input to the curve, will be an exact output, when these same instruments are valued using this curve. Here, the term structure of spot returns is recovered from the bond yields by solving for them recursively, by forward substitution:  $t$
