The Four Fundamental Forces of Nature - Clear IAS

Gravity and electromagnetism are just two of the four fundamental forces of nature, specifically two that you can observe every day. What are the other two, and how do they affect you if you can't see them? The remaining two forces work at the atomic level, which we never feel, despite being made of atoms.

Fifth force - Wikipedia

A fundamental force of nature is an
attraction or repulsion between objects
as described through interactions
between fields and particles. Physics has
identified four basic types of these
interactions, which together describe
every action we see in the Universe,
from the decay of atomic particles to the
drift of entire galaxies.

The Four Fundamental Forces of Nature - PHDessay.com

In physics, there are four observed fundamental interactions (informally, "fundamental forces") that form the basis of all known interactions in nature: gravitational, electromagnetic, strong nuclear, and weak nuclear forces.

Physicists inform us there are four fundamental forces in nature. Many scientists believe fundamental forces will one day be explained by means of a single, unified field theory. So far no one has come up with a viable mathematical package.

Four Fundamental Forces Of The Nature

The universe is governed by four fundamental forces, or interactions. These forces are the strong nuclear force, weak nuclear force, electromagnetic force, and gravity. The first two forces work on the atomic level but we can observe gravity and electromagnetism every day.

Fundamental Forces in nature, Gravitational forces ...

The forces are called fundamental because there is no simpler way for physicists to understand what the forces do or how they do it (their action). They are called interactions because the action of one object on another is matched by a reaction from the other. We feel the effects of gravity and electromagnetism all the time.

What are the four fundamental forces of nature ...

The fundamental forces (or fundamental interactions) of physics are the ways that individual particles interact with each other. It turns out that every single interaction observed taking place in the universe can be broken down and described by only four (well, generally four—more on that later) types of interactions:
