### Trapping in the Unimak Area

Two uncharged objects (metal plates for instance) will experience an attractive force between them, the magnitude of which increases as they are brought closer together. This force, or Casimir effect, is caused by vacuum fluctuations of the electromagnetic field. Effectively, more modes outside than between the objects results in the objects being pushed together.

Hongzhang Chen, in Lignocellulose Biorefinery Engineering, 2015. Kraft lignin. Kraft lignin is a kind of industrial lignin obtained from Kraft pulp, which accounts for about 85% of the total lignin production in the world. The Kraft pulp method is the main method for converting coniferous wood to pulp; the pulping yield is higher than other alkaline pulping methods.

Hydrogen is important for energy applications such as fuel cells but tends to diffuse into materials and make them more susceptible to fracture. Chen et al. tackled the challenge of identifying the exact location of hydrogen atoms in two common steels. The light weight and high mobility of hydrogen creates serious problems with conventional techniques.

Optical trapping can immobilize particles such as cells and macromolecules that swim in the solution, which is crucial for suppressing thermal fluctuations that will inhibit subdiffraction imaging. The combination of optical trapping and SR microscopy provides access to the mechanical and structural information of the specimen [174, 175].
