3D Printing Welding Fixtures. The only thing more critical to welding success than good fixturing is a good welder. For welds more complex than joining planar surfaces, welding fixtures help welders ensure that they're joining the right things together in the right locations. Conventional welding fixtures tend to fall into three categories—expensive machined components, uncustomized modular fixturing, and hacked-together solutions.

Clamps, magnets, fixtures and other welding positioners you'll find here will help align and hold sheet metal and tubular parts that are otherwise too difficult or impossible to accomplish by hand. These tools will eliminate much of the guesswork while setting up to weld during metal fabrication.

The answers to these question should be on the weld drawings for the product. Usually, in a well planned out line, there is a product drawing of the sub assembly produced in the fixture that you are going to be designing. Study the drawing for the location of the welds. If there is no such drawing, ask!

Of course, in real-life product assembly, designs must be more complex. But that doesn't mean we can't borrow some wisdom from childhood and create designs that naturally self-locate—or designs that fit together smoothly enough to self-fixture during more permanent assembly, such as glueing and welding.

The objective of the integration of the fixture and clamping / locating device is to insure that the weld joint location repeats, in a 3-dimensional space relative to the system, within +/- half the diameter of the applied welding wire. For example, using 0.045" diameter wire allows a tolerance of +/- 0.022".

Correctly locating the datum features of the assembly, clamping points, and weld joint access are all critical components to the outcome of any robotic welding project. Fail-safe solutions are incorporated into every fixture so issues such as improper fusion, voids, weld beads, and weld porosity are prevented.
