Wheat biotechnology: A minireview Due to the inherent difficulties associated with gene delivery into regenerable explants and recovery of plantlets with the introduced transgene, wheat was the last among cereals to be genetically transformed.

~~Effects of silver nitrate on the tissue ... - SpringerLink~~

Bacteria are the most dominant group of this diversity which produce a wide range of products of industrial significance. Paenibacillus polymyxa (formerly Bacillus polymyxa), a non pathogenic and endospore-forming Bacillus, is one of the most industrially significant facultative anaerobic bacterium.

In the present study, a high efficiency regeneration system was developed in wheat (Triticum aestivum L.) cv. Inqilab-91. Mature embryos were taken as explant source and inoculated on MS media for callus induction. MS media with different concentrations of 2, 4-D (2mg/l, 3mg/l and 4mg/l) were used for callus induction.

~~HIGH FREQUENCY REGENERATION SYSTEM OPTIMIZATION FOR WHEAT ...~~

Durum wheat is considered to be more recalcitrant than bread wheat and so far only two reports of its transformation exist [2,11]. These two reports have also employed immature embryo-derived explants as the target tissue for delivery of marker genes [2], and high-molecular weight glutenin subunit (HMW-GS) genes [11].

~~Wheat biotechnology: A minireview~~

Particle bombardment is the most widely employed procedure for the introduction of marker genes and also for the generation of transformed wheat with introduction of agronomically important genes for quality improvement, engineering of nuclear male sterility, transposon tagging, resistance to drought stress, resistance against fungal pathogens and insect resistance.

~~Wheat biotechnology: A minireview~~

Wheat is the world's most important crop that excels all other cereal crops both in area and production, thereby providing about 20.0 per cent of total food calories for the people of the world.

## ~~Wheat Biotechnology A Minireview~~

Wheat biotechnology: A minireview 76 protocols, microspore embryos and immature inflorescences are emerging as suitable target tissues for genetic transformation experiments. Till date, the biolistics approach has been most successful in delivering foreign genes into wheat. Scorable markers Initial steps for genetic transformation involves delivery of a

## ~~VECTOR CONSTRUCTION STRATEGIES FOR TRANSFORMATION OF WHEAT ...~~

Abstract. After rice, wheat is considered to be the most important world food crop, and the demand for high-quality wheat flour is increasing. Although there are no GM varieties currently grown, wheat is an important target for biotechnology, and we anticipate that GM wheat will be commercially available in 10–15 years.

Annual world production of wheat was around 685 million tons in 2009. In order to meet the growing need for wheat, production should be raised to an annual rate of 2%, without any additional land (Patnaik, 2001). Because of being a slow process, conventional plant breeding strategies have failed to fulfill this demand.

Pocket K No. 38: Biotech Wheat. Wheat is a member of the grass family that produces modified fruit which is fused with its single seed, forming the grain. The fruits are borne together in a panicle and the edible part of the seed or grain is called kernel. The Middle East is the geographical origin of wheat<sup>1</sup>.

## ~~Biolistic and Agrobacterium Mediated Transformation ...~~

Abstract | Wheat is the most essential food used by nearly 40% of the total population of the world. Yellow or stripe rust (produced by *Puccinia striiformis*), is a globally significant disease of wheat. Stripe rust was primarily considered a disease of cooler climate (2°C - 15°C), upper altitudes and northern latitudes, but current epidemics of the disease have confronted this supposition ...

Effects of silver nitrate on the tissue culture of immature wheat embryos. Abstract The immature embryos of four common wheat ( *Triticum aestivum* L.) genotypes with desirable agronomic traits were evaluated for their tissue culture response to ethylene antagonist, silver nitrate, added to callus-inductive and subculture media at six concentrations.
